

Senior Business Analyst (Data & Platform Integration) – Contract

Overview

We are seeking an experienced Senior Business Analyst to join a major strategic transformation programme focused on integrating newly acquired businesses onto a global investment platform.

Work as part of Programme where you will play a key role in understanding data environments, defining requirements, analysing data structures, and supporting the successful integration of multiple businesses into a common platform. This is a highly visible role requiring a strong blend of business analysis, data analysis, stakeholder engagement, and technical understanding.

This position is best suited to a senior-level consultant who can operate independently, engage effectively with technical and business stakeholders, and contribute immediately to a complex enterprise transformation programme.

Key Responsibilities

- Analyse existing business and data landscapes across acquired organisations.
- Gather, document, and validate business and technical requirements.
- Perform data mapping and data analysis activities to support platform integration.
- Work with business stakeholders, architects, and technical teams to define target-state solutions.
- Understand and document data models, data flows, and system integrations.
- Support the migration and onboarding of data onto enterprise data platforms.
- Collaborate with teams responsible for APIs and integration services.
- Facilitate workshops and requirements-gathering sessions with stakeholders.
- Produce high-quality analysis artefacts and documentation.
- Support programme delivery across multiple workstreams within a large transformation environment.

Required Experience

- Significant experience as a Senior Business Analyst within Wealth Management or Asset Management environments.
- Strong background working on large-scale data transformation, integration, or platform migration programmes.
- Experience gathering and documenting business and technical requirements.
- Strong understanding of data mapping, data analysis, and data integration concepts.
- Experience working with enterprise data platforms and complex data environments.
- Knowledge of Enterprise Data Management (EDM) principles.
- Ability to engage confidently with architects, technical teams, and senior business stakeholders.
- Proven track record delivering on large enterprise programmes.
- Experience working with Databricks environments.
- Experience supporting acquisition, merger, or business integration programmes.
- Exposure to API-led integrations.
- Understanding of data modelling concepts and methodologies.
- Experience working within investment management platforms and ecosystems.
